

1 **ABSTRACT OF THE DISCLOSURE**

2 A tool suspension plate for a screwdriver set has a base, a resting
3 flange formed on the base, a positioning bracket detachably mounted on the
4 base, and multiple stop plates formed on the base and above the resting flange.
5 Thereby, a screwdriver composed of a shaft and a handle is enabled to extend
6 the shaft through the resting flange and rest the handle on the resting flange.
7 Then, the positioning bracket is attached on the base to securely hold the
8 handle of the screwdriver on the base. Additionally, one corresponding stop
9 plates abuts a top of the handle to limit the screwdriver from being pulled
10 upward. Thereby, the tool suspension plate has excellent thief-proof,
11 displaying and retaining effects.
